Professional Summary

Data-focused Software Developer with hands-on experience building ETL pipelines, automation tools, and operational dashboards within healthcare environments. Proven ability to identify inefficiencies in real-world workflows and develop scalable solutions using Python, SQL, and modern web technologies.

Currently supporting large-scale clinical device deployment while independently developing data-driven systems to improve reporting, validation, and process efficiency. Passionate about bridging technical systems and business operations through automation and data insights.

Technical Skills

Languages: Python, JavaScript, SQL, C++, C#

Frameworks & Tools: Flask, React, Node.js, Express, Tkinter

Data & Analytics: SQL Server, PostgreSQL, SQLite, ETL Pipelines, Power Query, Data Modeling

Systems & Platforms: Linux (Ubuntu), Windows, Git, GitHub, Apache, REST APIs

Other: IoT (ESP32), ZPL Labeling, Cloudflare, AI-assisted development workflows

Professional Experience

Technical Device Readiness (TDR) Associate (Contract)

Apex Systems / BJC HealthCare — St. Louis, MO

2025 – Present

- Supported deployment and validation of **100+ clinical devices** (Zebra printers, barcode scanners) across multiple hospital locations during Epic system implementation
 - Developed Python automation scripts to execute **batch printer testing via IP**, reducing manual validation time by an estimated **60–80%**
 - Built PowerShell automation to launch required tools and environments, decreasing workstation setup time by **~50% per technician**
 - Assisted in identifying workflow inefficiencies and opportunities for automation across device testing and reporting processes
 - Contributed to large-scale readiness efforts supporting **enterprise-wide clinical system rollout**
-

Technical Projects

Healthcare Device Tracking & ETL Dashboard

Python • SQLite • Flask

- Designed and implemented ETL pipelines processing **hundreds of device records per run** across multiple locations

- Built a web-based dashboard tracking KPIs (completion %, status distribution, location performance), improving visibility from static reports to **near real-time insights**
 - Replaced manual Excel-based reporting workflows, reducing data refresh time from **hours to seconds**
 - Structured data models to support scalable tracking of device status, locations, and testing outcomes
-

Hospital Integration Simulator

Python • PostgreSQL • Tkinter

- Developed a simulation tool modeling healthcare device integration workflows and system interactions
 - Designed a database-driven architecture to manage device records and simulate real-world integration processes
 - Built an interactive UI for testing and visualizing system behavior
-

Financial ETL & KPI Reporting System

SQL Server • Power Query • Excel

- Built automated ETL workflows transforming raw datasets into structured KPI dashboards
 - Processed and visualized **large multi-source datasets**, enabling faster analysis and decision-making
 - Reduced manual data preparation effort by **70%+** through automation and query optimization
-

IoT Automated Storage & Retrieval System

ESP32 • Stepper Motors • Sensors

- Designed and built a microcontroller-based automation system controlling physical storage compartments
 - Implemented precise stepper motor logic for compartment alignment and retrieval
 - Integrated hardware and software components to create a functional prototype solving a real-world storage problem
-

Education

Bachelor of Science – Software Programming

DeVry University — May 2025

GPA: 3.57

Honors

- Academic Honors Graduate
- Dean's List
