---

Professional Summary

Early-career Software Developer and Data-focused Engineer with direct experience building ETL pipelines, dashboards, and automation tools in healthcare environments. Proven ability to identify process inefficiencies and develop scalable solutions using Python, SQL, and modern web technologies.

Currently supporting device deployment and testing workflows in a clinical setting, while independently developing data pipelines and reporting systems to improve operational visibility. I am enthusiastic about using data and automation to drive measurable impact.

Technical Skills

Languages: Python, JavaScript, SQL, C++
Frameworks/Tools: Flask, React, Node.js, Express, Tkinter
Data & Analytics: SQL Server, SQLite, Power Query, ETL Pipelines, Data Modeling
Tools & Platforms: Git, GitHub, VS Code, SSIS (basic), Excel Automation, REST APIs
Other: IoT (ESP32), ZPL Labeling, Process Automation, AI-assisted development workflows

---

Professional Experience

Technical Device Support / TDR Associate (Contract)

BJC HealthCare (via Apex Systems) — Missouri
2025 – Present

- Supported large-scale deployment and testing of clinical devices including Zebra printers and barcode scanners across multiple hospital locations.
- Analyzed testing data and workflows to identify inefficiencies and opportunities for automation.
- Built internal dashboards using Excel, Power Query, and later Python/SQLite/Flask to track device testing progress and KPIs.
- Reduced reporting friction by automating data aggregation and enabling faster visibility into project status.
- Collaborated with cross-functional teams to validate device configurations and ensure readiness for clinical use.

Help Desk Analyst (Tier 1)

TEKsystems / Chubb — 2025

- Provided technical support for end users, troubleshooting hardware, software, and access issues.
- Documented incidents and resolutions, improving knowledge sharing across support teams.
- Maintained strong customer service while resolving technical issues in a fast-paced environment.

Help Desk Analyst (Tier 1)

Frontline Managed Services — 2024

- Delivered first-line technical support and resolved user issues related to systems and applications.
- Assisted with account management, access provisioning, and troubleshooting workflows.

Projects

Healthcare Device Tracking & ETL Dashboard

- Designed and implemented a data pipeline using Python and SQLite to ingest, transform, and store device testing data.
- Built a Flask-based dashboard to visualize KPIs such as completion rates, status breakdowns, and location-level metrics.
- Replaced manual Excel workflows with automated processes, improving data refresh speed and reliability.

Hospital Integration Simulator

- Developed a Python-based simulation tool to model device registration and integration workflows.
- Implemented database-backed architecture (PostgreSQL/SQLite) to manage device records and simulate real-world processes.
- Designed UI using Tkinter to interact with system components and visualize operations.

Retail Microservices Management System

- Built a multi-service architecture with separate modules for inventory, POS, and employee management.
- Developed RESTful APIs using Java/Node.js (depending on your last version) and implemented authentication flows.
- Demonstrated understanding of distributed systems and service communication.

IoT Automated Storage & Retrieval System

- Designed and built a physical automation system using ESP32, stepper motors, and sensors.
- Programmed control logic to manage storage compartments and retrieval operations.
- Combined hardware and software integration to solve a real-world automation problem.

Education

Bachelor of Science in Software Development
DeVry University — 2025
GPA: 3.57
