Professional Summary

Data-focused Software Developer with hands-on experience building ETL pipelines, automation tools, and operational dashboards within healthcare environments. Proven ability to identify inefficiencies in real-world workflows and develop scalable solutions using Python, SQL, and modern web technologies.

Currently supporting large-scale clinical device deployment while independently developing data-driven systems to improve reporting, validation, and process efficiency. Passionate about bridging technical systems and business operations through automation and data insights.

Technical Skills

Languages: Python, JavaScript, SQL, C++, C#
Frameworks & Tools: Flask, React, Node.js, Express, Tkinter
Data & Analytics: SQL Server, PostgreSQL, SQLite, ETL Pipelines, Power Query, Data Modeling
Systems & Platforms: Linux (Ubuntu), Windows, Git, GitHub, Apache, REST APIs
Other: IoT (ESP32), ZPL Labeling, Cloudflare, AI-assisted development workflows

---

Professional Experience

Technical Device Readiness (TDR) Associate (Contract)

Apex Systems / BJC HealthCare — St. Louis, MO
2025 – Present

- Supported deployment and validation of clinical devices (Zebra printers, barcode scanners) across multiple hospital locations during Epic system implementation
- Developed Python scripts to automate printer testing via IP-based batch execution, significantly reducing manual validation time
- Built PowerShell automation to streamline workstation setup, improving technician efficiency and reducing repetitive setup steps
- Analyzed device testing workflows and identified opportunities for automation and improved reporting
- Contributed to large-scale readiness efforts ensuring system reliability for clinical operations

---

Technical Projects

Healthcare Device Tracking & ETL Dashboard

Python • SQLite • Flask

- Designed and implemented an ETL pipeline to ingest and transform device testing data across multiple locations

- Built a web-based dashboard to track KPIs including completion rates, status distribution, and location-level performance
- Replaced manual Excel workflows with automated data processing, improving reporting speed and consistency

---

Hospital Integration Simulator

Python • PostgreSQL • Tkinter

- Developed a simulation tool modeling healthcare device integration workflows and system interactions
- Designed a database-driven architecture to manage device records and simulate real-world integration processes
- Built an interactive UI for testing and visualizing system behavior

---

Financial ETL & KPI Reporting System

SQL Server • Power Query • Excel

- Built automated ETL workflows to process operational datasets and generate business-focused KPI dashboards
- Transformed raw data into structured insights using Power Query and relational database design
- Demonstrated enterprise-style reporting and data pipeline design

---

IoT Automated Storage & Retrieval System

ESP32 • Stepper Motors • Sensors

- Designed and built a physical automation system integrating hardware and software for controlled storage and retrieval
- Implemented microcontroller-based logic for precise movement and compartment control
- Combined embedded systems with problem-solving for real-world automation use cases

---

Education

Bachelor of Science – Software Programming
DeVry University — May 2025
GPA: 3.57

Honors

- Academic Honors Graduate
- Dean’s List
